Keyboard Shortcuts A popular way of making shortcuts is to create keyboard combinations. Shortcuts can be easily created using the AutoCAD shortcut utility: How to Make a Shortcut Select the command you wish to assign a shortcut to. There are many, many commands in AutoCAD. Here we are going to create a shortcut to the Move command, the most frequently used command in AutoCAD. Go to the New shortcut dialog. Use the Add button to add a new shortcut. Use the other two fields to specify the name of the shortcut. The shortcut name is not important, but the name should be descriptive. After entering the shortcut name, press the Finish button to save it. In the next step, you need to create a new shortcut that you can use to execute the command. Select the command you wish to execute, in this case, the Move command. Go to the New shortcut dialog. Use the Add button to add a new shortcut. Use the other two fields to specify the name of the shortcut. After entering the shortcut name, press the Finish button to save it. When you are done with all of the shortcuts you want to create, use the Remove button to delete them all. Then click OK to close the dialog box and return to the program. You can now assign the shortcut you just created to the Move command by pressing the (.) button on the keyboard. The shortcut will not appear in the list of the available commands, but if you press the (.) button, the shortcut will execute. Note: You need to enter the shortcut name, not the shortcut. Only the shortcut name will appear in the shortcut list, while the shortcut remains inactive. Examples of Shortcuts These examples show how to use the shortcuts that we have created. Move to any object using the (.) keyboard shortcut Use the shortcut you created to move to the selected object. Draw a rectangle by holding down the Shift key and pressing (.) Fiber optic connectors are employed in the telecommunications and data communications fields to facilitate the transfer of light between an optical fiber and an electronic device, such as a transceiver, having an optoelectronic device. As a fiber optic connector, the MTP (miniature telecentric projector) type connector is known in the art and is available commercially, for example, from Lucent Technologies (Pleasanton, Calif.). The MTP connector includes a metallic housing that defines a through-transmission window, such as a connector ferrule. The ferrule defines a sleeve-like termination and a proximal end that is adapted to be coupled to a mating connector. The ferrule has a distal end that includes an optical fiber and an optoelectronic device mounted thereon, e.g., an LED or a laser diode. A tube or sleeve-like ferrule holder supports the ferrule. The sleeve holder is typically fabricated of plastic and defines a through-transmission window for receiving the sleeve-like ferrule. The MTP connector is designed to maintain alignment of the optical fiber with the optoelectronic device during the mating and unmating of the connectors. The MTP connector includes a first crimp sleeve that is attached to the ferrule holder, typically using an epoxy adhesive. A second crimp sleeve, which can be crimped or bonded to the first crimp sleeve, defines a primary aperture for receiving a mating ferrule. During the mating and unmating of two MTP connectors, relative axial displacement between the two connectors causes the secondary sleeve to move, which can lead to axial and angular alignment problems. As a result, there exists a need in the art for a fiber optic connector that prevents axial and angular misalignment of the optical fiber within the connector during mating and unmating. There further exists a need for a fiber optic connector that maintains alignment of the optical fiber within the connector to reduce optical signal loss. There also exists a need in the art for a fiber optic connector that is readily attachable and detachable from a mating connector and from a mating ferrule. The present invention relates to an improved fiber optic connector that has enhanced optical performance characteristics. The fiber
