Ganesh Rao.Risk tolerance of nanostructured solids for use in space vehicles. The risk tolerance of nanostructured solids was assessed by conducting a 2.5-year aging study (2008-2011) of four nanostructured solids, namely C-60, C-70, zeolitic imidazole framework-8 (ZIF-8), and cubic boron nitride (c-BN). The selected nanostructured solids were selected for a base case aging study in concert with two other solids, which were not selected for the study and are therefore referred to as the "control" solids. The selected nanostructured solids were synthesized using a chemical vapor deposition process and deposited onto barium titanate (BaTiO<sub>3</sub>) substrates by drop deposition. Two control solids were deposited onto mica substrates and one each onto Al and stainless steel (SS) substrates by drop deposition. The aging study included the evaluation of the selected and control nanostructured solids for their mechanical, structural, and electrical properties. The impact of the solids on the aging of the substrates was investigated in two phases: (a) an initial impact study (2008-2009) in which the aging study was conducted by cycling the experimental aging units during which the materials are cycled from temperatures ranging from room temperature to 350 degrees C and (b) an extended impact study (2010-2011) in which the aging study was conducted by exposing the samples to a more realistic aging environment that also includes ionizing radiation and 10-100% relative humidity conditions for periods up to 24 months. The results from these studies demonstrate that the selected nanostructured solids are at least as good as the control solids in their resistance to the aging environment. Leeds fans were hoping the club had finally got what they wanted. They had given the club a blank cheque. And they had spent over £100m on players, to boot. Not just a great land deal, but a long-term plan to propel them to the summit of the English game. But now they have ended up with a need to firebomb the Leeds home as chaos engulfed the Elland Road pitch. Yorkshire newspapers report
